

## Process of model selection for Habitat (GAMM) model

Method: Starting from the full model, shown in the formula as r code, all smooth terms were removed and AIC values were compared. The model with the lowest AIC-value was taken as new model to remove smooth terms until the removal of terms could not reduce AIC values anymore. The final model is marked in fat font. Latitude\*longitude and year were not removed for reasons of spatial and temporal autocorrelation.

Tab. S1: Model select selection for the European hare habitat model

formula	Model	df	AIC	BIC	logLik	
<i>gamm(log1p(number of hares) ~ s(maize)+s(winter grains)+s(grassland)+s(forest)+ s(precipitation) +s(vixen with litter)+ s(sugar beet)+ s(winter oilseed rape)+s(wildflower strips)+s(summer grains) +s(temperature)+s(Long,Lat)+, correlation=corAR1 (form=~year municipality), random=list(municipality=~1) , method="ML")</i>

Fig. S1 Mean number of the European hare per km<sup>2</sup> open land per municipality. As part of the wildlife survey estimates are recorded through annual questionnaires of local hunters summarized for six natural regions from 1991-2015. Including regression lines for two time periods (1991-2005, 2005-2015).

Tab. S2: Slopes of the regression lines for two time periods (1991-2005, 2005-2015) and their 95% confidence intervals, separately for each natural region.
