Appendix 2. Additional details for this systematic review and changes from the protocol.

Deviations from protocol

- The risk of bias of included non-randomized studies was initially planned to be assessed with the Downs and Black tool that is suggested in the Cochrane Handbook. However, the ROBINS-I ("Risk Of Bias In Non-randomized Studies - of Interventions") tool has been developed in the meantime and is suggested by the Cochrane Collaboration for non-randomized studies, so we switched to this improved tool.
- The number needed to treat was planned to be calculated to clinically translate the results of meta-analyses statistically significant relative risks, but no statistically significant relative risks were ultimately found by meta-analyses.
- Possible sources of heterogeneity were planned a priori in the protocol to be sought through mixed-effects subgroup analyses and random-effects meta-regression for meta-analyses of at least five studies. This could ultimately not be assessed, as less than 5 studies were included in any meta-analysis.
- Reporting biases were planned to be assessed for meta-analyses of at least 10 studies using contour-enhanced funnel plots and with the Egger's weighted regression test. This could ultimately not be assessed, as less than 10 studies were included in any meta-analysis.
- The robustness of the results was planned to be checked a priori with sensitivity analyses based on (i) inclusion/exclusion of trials with low risk of bias and (ii) improvement of the GRADE classification. However, all results were based on one, two, or seldom three trials and therefore any trial omissions were not deemed stable.

Appendix 3. List of included/excluded studies with reasons.

*separate measurements for right and left TMJs were given—the left one was taken in random.

Appendix 5. Detailed assessment of the quality from performed meta-analyses according to the GRADE approach used to construct Table 4.

Outcome	RoB	Indirectness	Inconsistency	Imprecision	Publication bias	Large effect	Dose response	Confounding
Anterior joint space	Serious	Ok	No	Ok	NA	Yes [†]	NA	Still existing
Posterior joint space	Serious	Ok	No	Ok	NA	Yes [†]	NA	Still existing
Superior joint space	Serious	Ok	No	Ok	NA	Yes [†]	NA	Still existing
Anterior angle	Serious	Ok	No	Serious	NA	No	NA	Still existing
Posterior angle	Serious	Ok	Mild*	Serious	NA	Yes [†]	NA	Still existing
Condylar coronary width	Serious	Ok	Mild*	Serious	NA	No	NA	Still existing
GleFo sagittal displacement	Serious	Ok	No	Ok	NA	No	NA	Still existing
GleFo vertical displacement	Serious	Ok	No	Ok	NA	No	NA	Still existing
Sagittal concentricity index	Serious	Ok	Serious	Serious	NA	No	NA	Still existing

* heterogeneity is high, but all studies are on the same side of the forest plot—i.e. heterogeneity affects only the precise quantification of the treatment effects, but not the decision whether treatment is effective or not.

† Large or very large effect magnitude is seen, but quality of evidence is not upgraded due to existing methodological limitations/risk of bias
